PreBilt™ for Purchase Requisitions & Purchase Orders

PreBilt for Purchase Requisitions & Purchase Orders

PreBilt for Purchase Requisitions and Purchase Orders (PRPO) allows users to easily track and approve purchase requisitions and generate purchase orders on the move, from any mobile device, for more efficient budgeting, forecasting and reporting.

With the capability to receive push notifications when new requisitions and orders are released, data is visible in real-time without users needing to log into SAP. Offering complete integration with SAP, users can view attachments and record comments through the app, which are then automatically updated directly into SAP.

Business Challenges

Inefficient Systems

Without an agile and efficient system for requisitions and ordering, you can often experience process bottlenecks, lost paperwork, inadequate audit trails and budget overspending.

Isolated Systems

Often, the order and requisition system are separate so data can not easily be viewed across systems, limiting the business insights that can be identified.

Spend Thresholds

Confusion over spend thresholds can lead to process disruption. Therefore, it is important to have a system in place that clearly outlines the level of spend that individual team members can authorise.

Financial Compliance

An uncontrolled financial environment, that doesn't allow real-time insights may mean spend is not allocated correctly, leading to infringements in corporate governance and compliance practices.

Time Intensive

Logging into SAP to input data can be a time-consuming task, particularly when a traditional desktop configuration is being used.

Order Fulfilment

With 'just in time' ordering now commonplace in many businesses, it is crucial purchase orders can be approved and actioned quickly to both fulfil customer requirements and maintain cash flow.

Business Benefits

PreBilt for PRPO provides direct integration with SAP, allowing immediate data visibility to offer a range of business benefits.

Increased Productivity

Reduce waiting times for PO approvals that can cause process delays, to streamline operations and increase productivity.

User Friendly

An intuitive interface offers easy navigation to reduce training times, increase process accuracy and improve employee engagement.

Flexibility

With the flexibility to cover staff working patterns and absences, the application can be set up to layer access for individual team members.

Full Audit Trail

Maintain a central record of all documentation to quickly and efficiently deal with any invoice queries to maintain cash flow.

Real-time Invoicing

Achieve more accurate and efficient invoicing to allow correct budgeting and spend allocation for more informed business forecasts.

Application Features

Media Support

Allows the display of supporting documents such as PDFs, images and videos.

Device Agnostic

Works on most mobile devices including smartphones, barcode data capture terminals, tablets and ruggedised mobile devices.

Offline Functionality

A cellular signal is not required as the app is self-contained within the mobile device.

Multi-language

Can be translated into any language to allow deployment globally across various users.

Customised Features

Ability to add customer fields based on individual business needs.

Multiple Sources

Combine numerous integrated ERP platforms and data repositories into one application.
